

openBIM for a nordic sustainable building industry

# Finnish requirements for energy simulation

New BIM requirements for energy analysis

Tuomas Laine, Granlund Oy

31.1.2013 BuildingSMART Client seminar, Copenhagen

Less energy gives more

# Granlund Oy – Company shortly

## Consultancy

- MEP design
- Facilities management
- Energy and sustainability

## Software

- RYHTI – facilities management
- RIUSKA – energy analysis
- BSPPro – IFC middleware

## Statistics

- 470 persons, 33 MEUR

Less energy gives more

## Common BIM Requirements 2012

Common BIM Requirements 2012, COBIM, is based on the BIM Requirements published by Seneca Properties published in. The update project was funded by Seneca Properties in addition to several other real estate owners and developers, construction companies and software vendors. BuildingSMART Finland participated also in the financing of the project. As a result, the updated Series 1-8 and new Series 10-12 were released in Finnish on March 27th, 2012.

Series 1: General part

Series 2: Modeling of the starting situation

Series 3: Architectural design

Series 4: MEP design

Series 5: Structural design

Series 6: Quality assurance

Series 7: Quantity take-off

Series 8: Use of models for visualization

Series 9: Use of models in MEP analysis

Series 10: Energy analysis

Series 11: Management of a BIM project

Series 12: Use of models in facility management

Series 13: Use of models in construction

### COBIM 2012 in English

The Common BIM Requirements, that were published March 27th 2012, are now available also in English. Click on the link COBIM 2012 in the menu.

# COBIM Series 10 for Energy Analysis

Less energy gives more

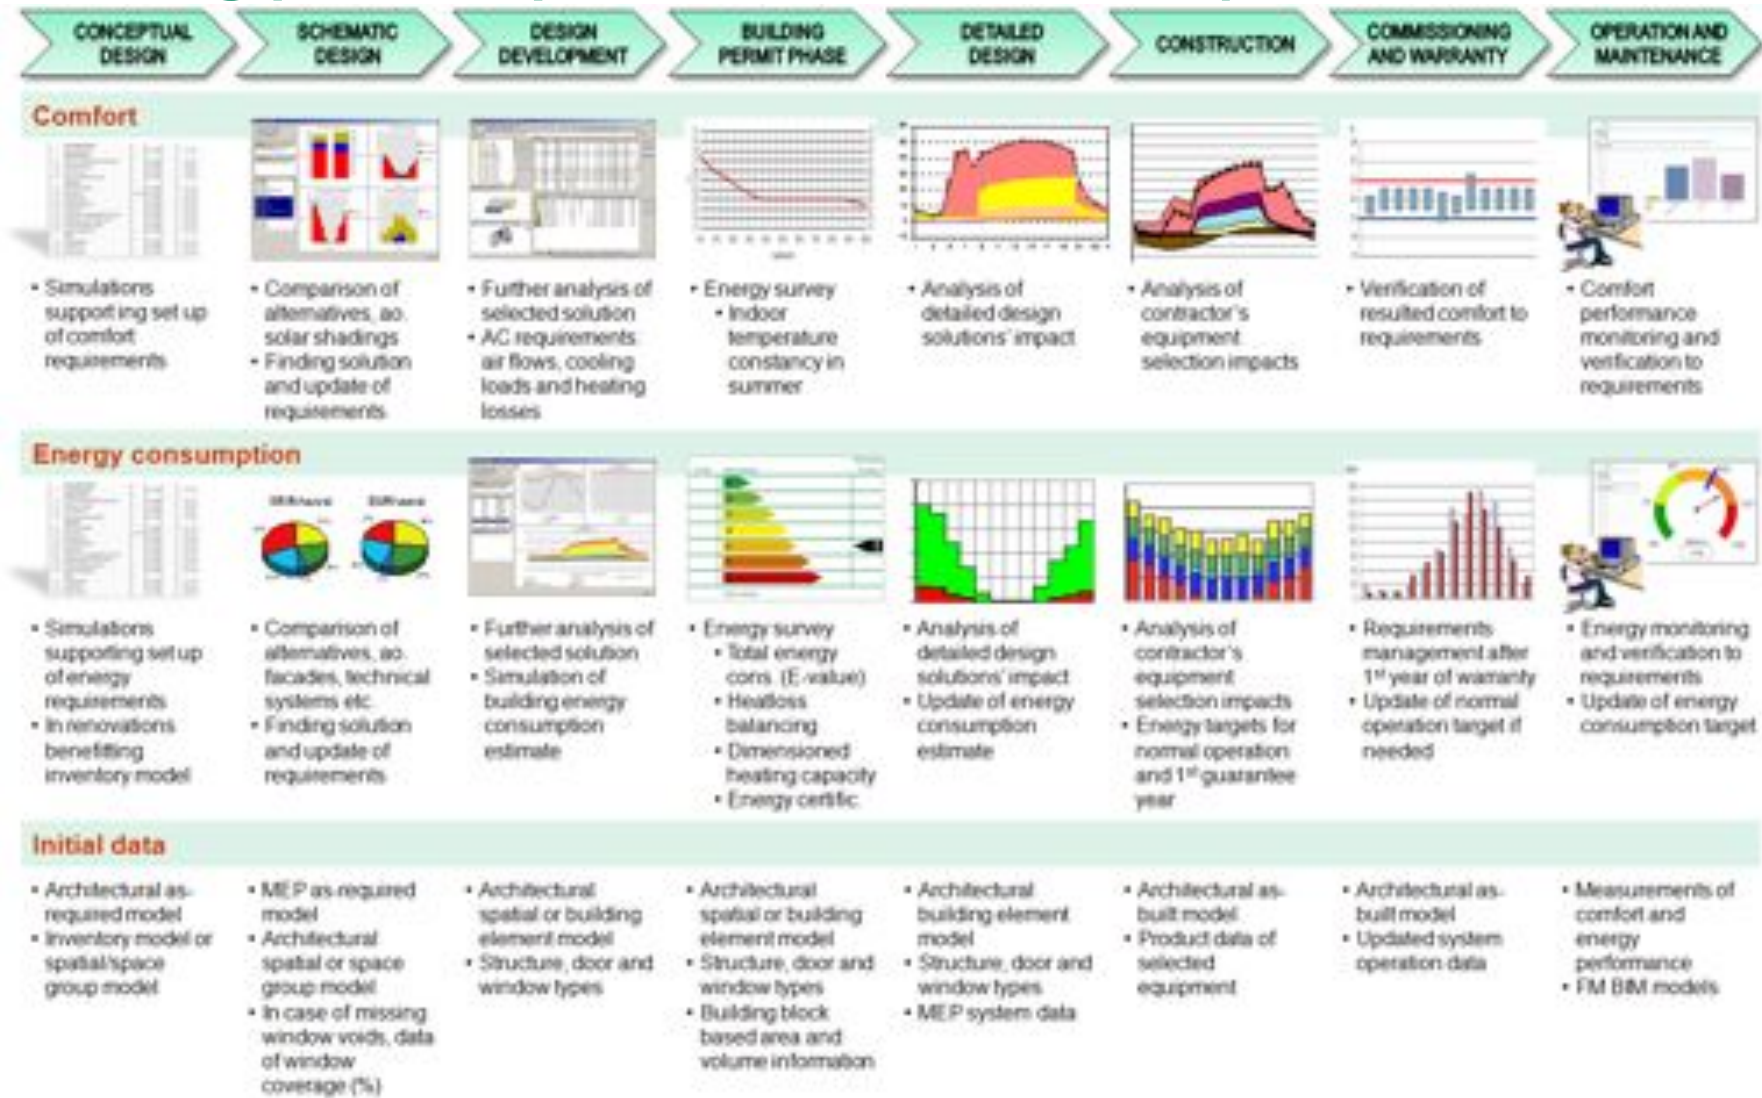

# Background

- New energy regulations 7/2012
  - Primary energy, E-value
  - Includes indoor condition constancy requirements
  - Standardized use and climate
  - Requirements for simulation tools: dynamic and validated
- New energy certificate – law was approved 18.12.2012
  - From measured to E-value based calculated certificate
  - Gradually also for small residential buildings
- New EU regulations (EPBD recast)
  - Public buildings 2019 “nearly zero energy buildings” (nZEB)
  - All new buildings 2021 “nearly zero energy buildings”

# Solution development during early design

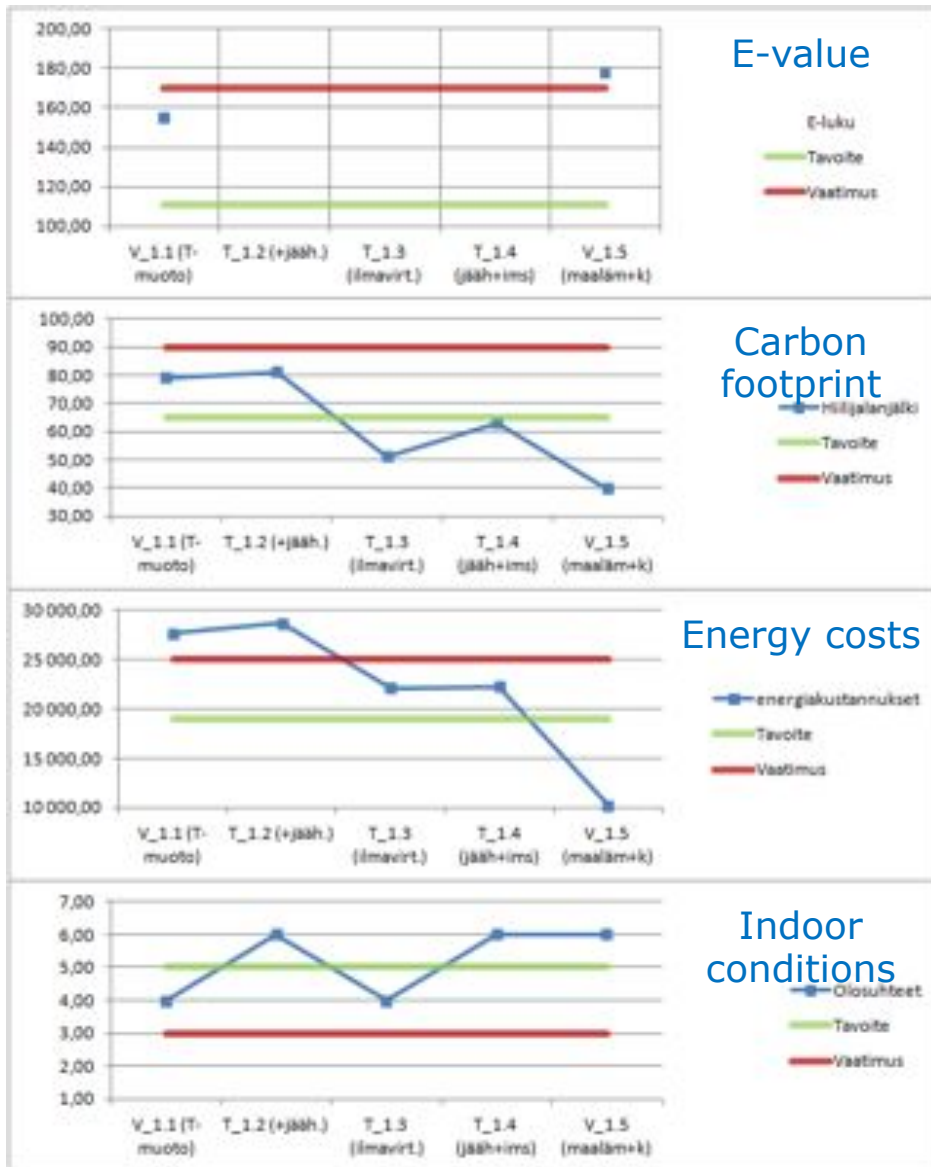

Less energy gives more

# Decisions need different metrics

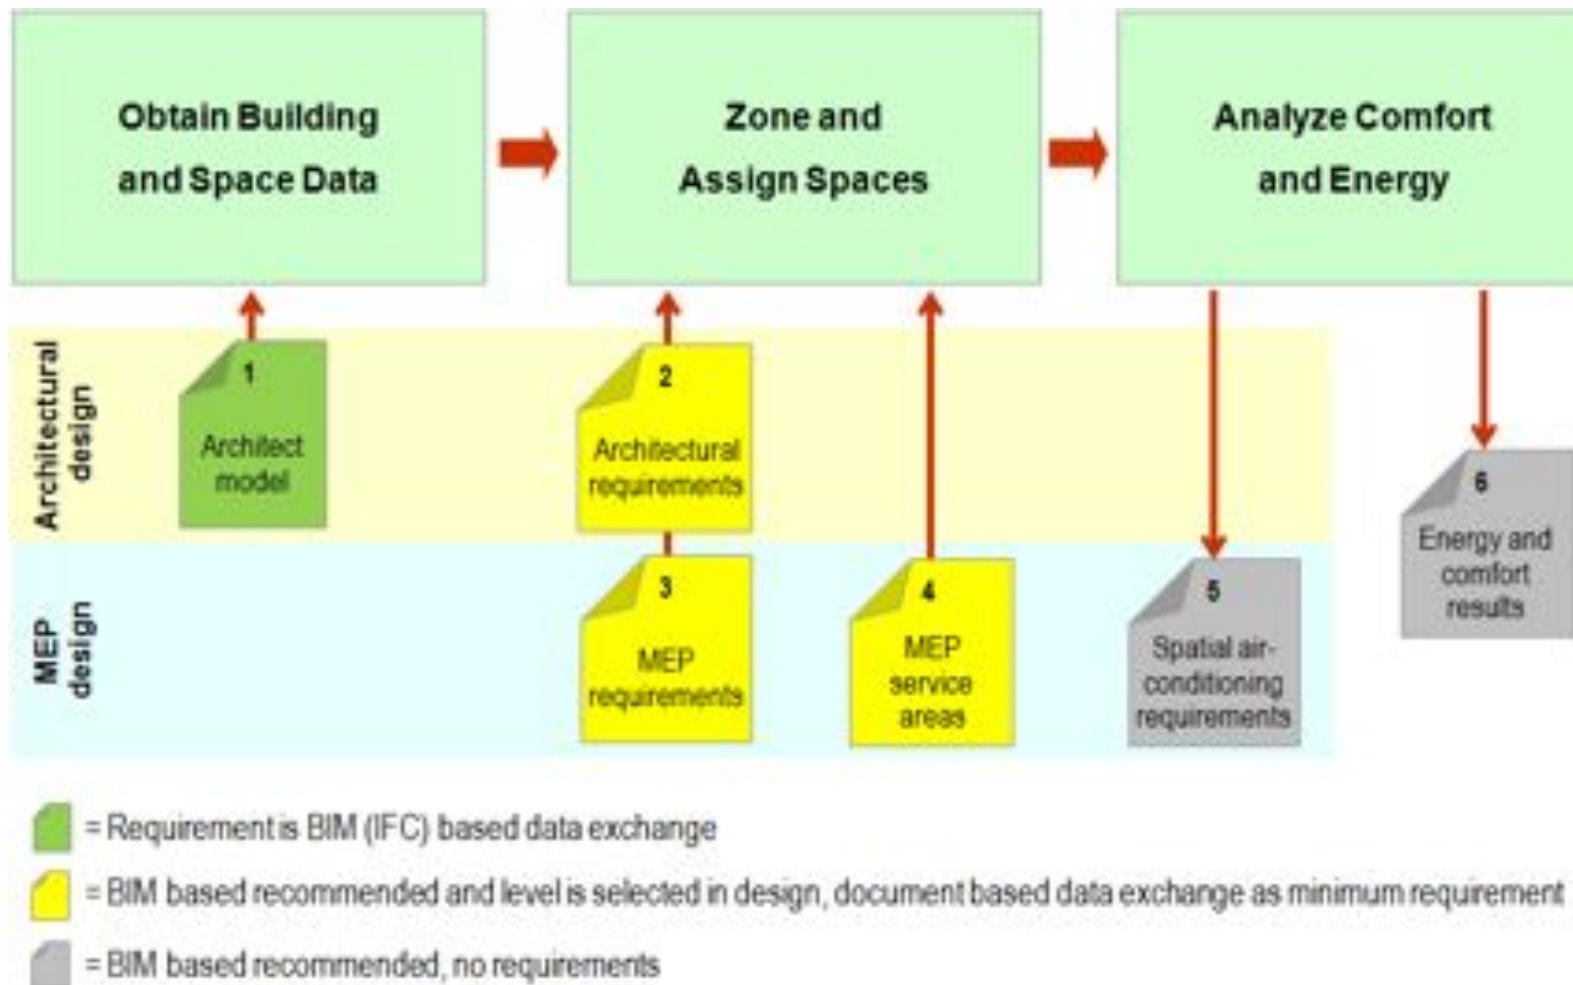

By team working and using of BIM and efficient simulation it was possible to analyze 15..20 design solutions (renovation and new building) during 2 days workshop (School/daycare building in Syväniemi, Kuopio, Finland)

# BIM helps in E-value calculation

- E-value measures the relative, primary energy weighted energy efficiency – not the real energy consumption of the building
  - > both simulations are needed
- In E-value calculation
  - Real building/spatial geometry (from BIM)
  - All spaces have equal use: schedules, loads, air flows (from energy analysis library)
  - Standardized weather (from energy analysis library)
  - Includes coldbridges (types and lengths from BIM)

# What is really required?

Less energy gives more

# Energy analysis software

## Requirements:

- IFC import (v. 2x3 or newer), when the model includes:
  - Coordination view
  - Space boundary add-on view (defines the surfaces surrounding the space and their connections to structures, openings etc.)
- Dynamic simulation (as in 7/2012 regulations)
- Alternatively allowed if required quality architectural model is not available because of software or justifiable modeling reason:
  - Energy analyst may create a separate geometry model, which fulfils the requirements
  - The space names and codes must equal to the architectural model
  - Working method shown to keep also the original space GUIDs
