

SITECH Norway as

Per-Ola Berntsen

Supportmanager

My background

- **Mapping and surveying college, Rud 1993**
- **Norkart and Blom ASA 1993-2009**
 - Topographical mapping
 - Ortophoto production
 - Terrainmodelling
 - Triangulation
 - LIDAR editing
 - Some terrestrial photogrammetry
- **Norgeodesi 2009-2011**
 - Support manager
- **SITECH Norway 2011 –**
 - Support manager, Application engineer Software

About SITECH

- **SITECH is an international brand owned by Trimble**
 - **SITECH has offices in more than 60 countries worldwide**
 - **SITECH is the Trimble Heavy and Civil Construction dealer**
 - **SITECH Norway is owned by PON Holding in Holland**
 - **Established in 2011**
-
-

What we deliver:

- **Trimble products range**
 - (Tekla among others)
- **Machine control GCS900**
- **Site control SPS and SCS900**
- **Business Center CAD software**
- **TCC two-way data (Cloud)**
- **Installation, training and consulting**

LandXML today

- **The use of LandXML for road designs is used extensively, but still a bit to go to be the main data exchange format. If that is the target.**
- **Tunnel format in LandXML is also «on its way».**

Customers

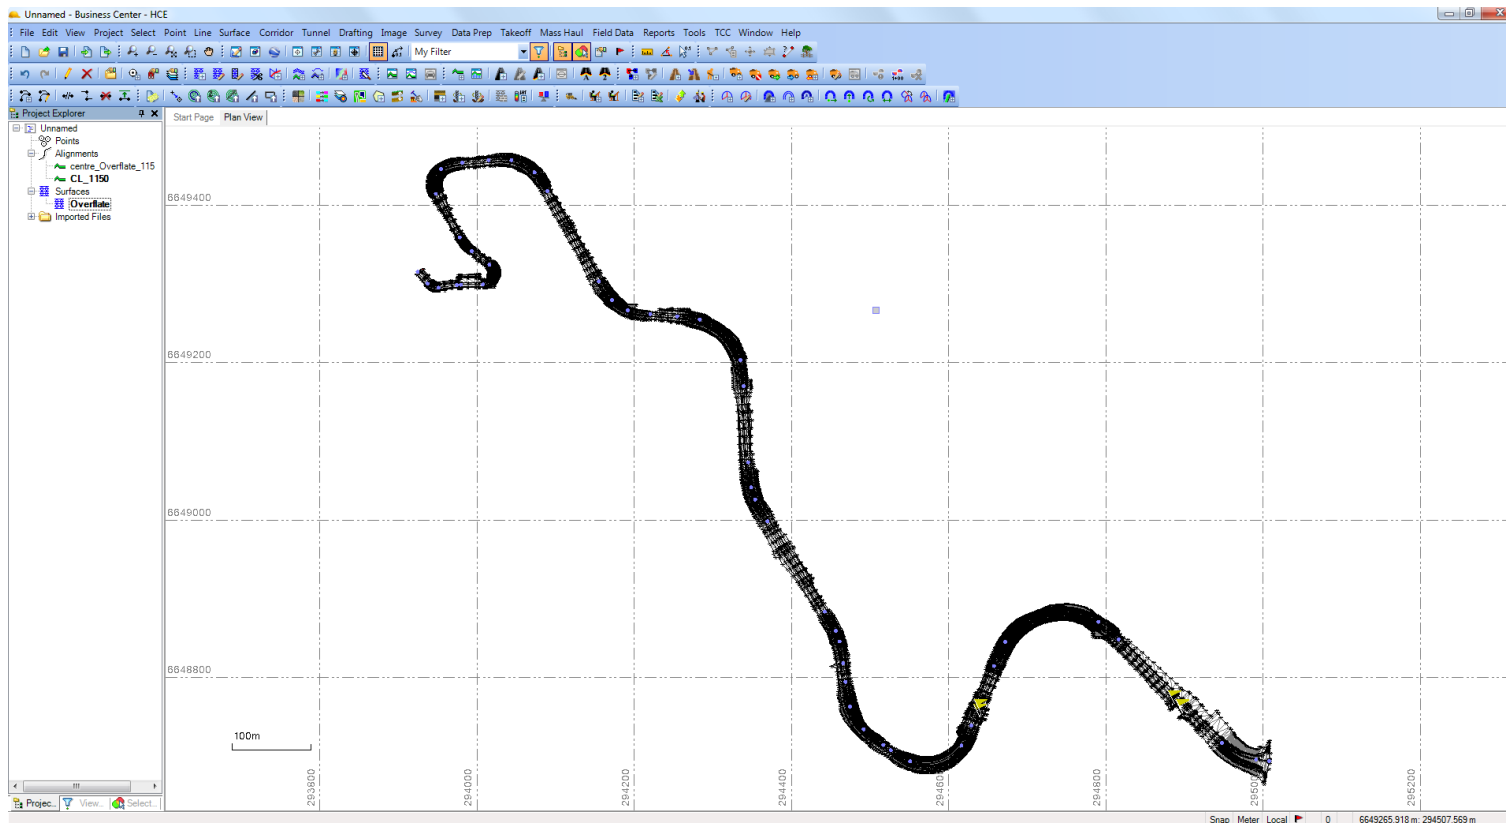

- **Quite many small entrepreneurs**
- **Less than 10 employees**
- **Has little or no knowledge about geodesi.**
- **Used to work with machines**
- **Must enter the computer world now.**
- **They have a computer, and that is about it.**
- **Some know VIPS. (ViaNova, Novapoint)**
- **For many people, VIPS is the same as road design.**

LandXML

- **For Trimble software users, this is a data conversion format.**
- **Trimble does not have a direct import into the machine or field controller.**
- **Main reason for this is the variations that can be found in the LandXML**
- **We want to control the data before we send it out for field use.**
- **As far as I know, the other manufacturers do the same, more or less.**
- **Some claim to use LandXML directly in the machine, but it is a special version of it.**

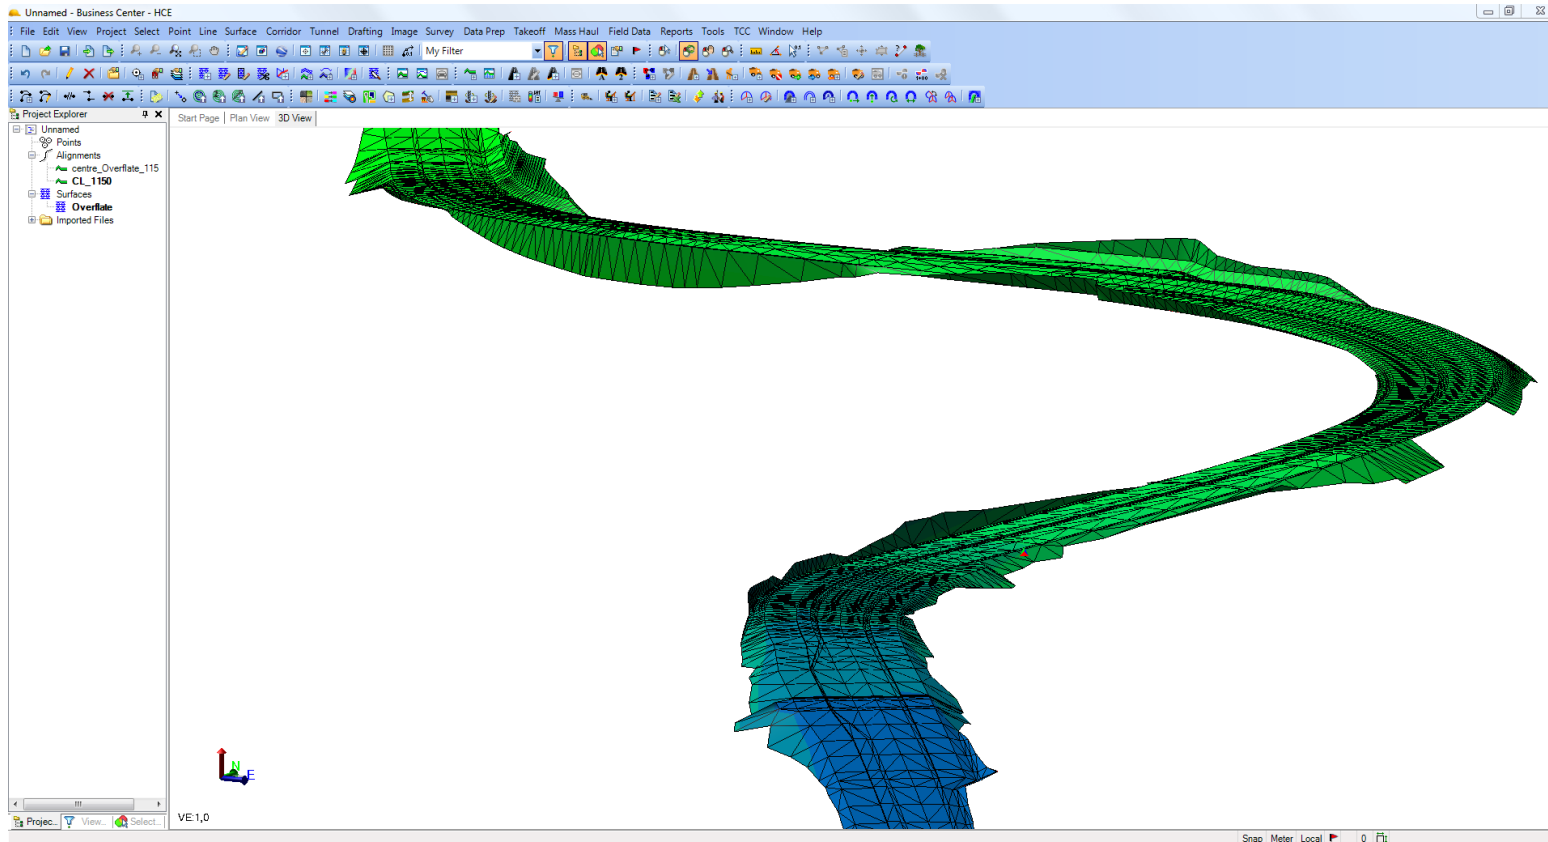

How we manage

- We import the LandXML to Business Center

We check the data

- We set the coordinate system
- And check for errors.

We can:

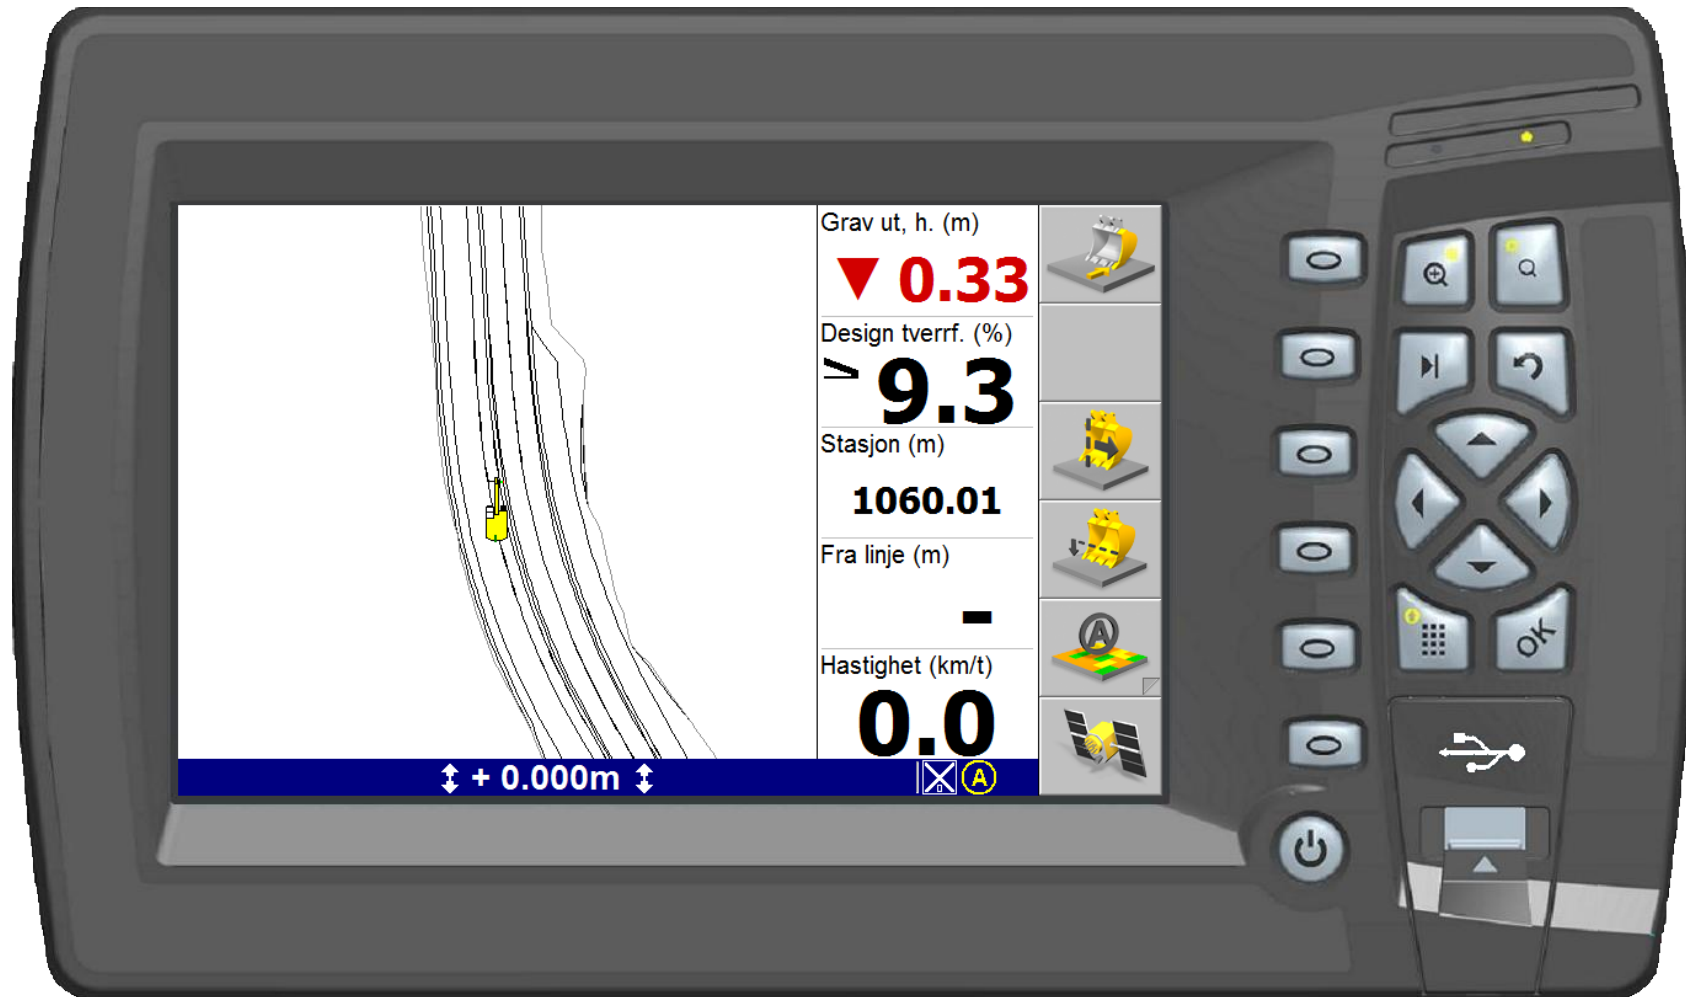

- Edit the Alignment
- Edit the surface
- Create or edit cross sections
- Offset the surface

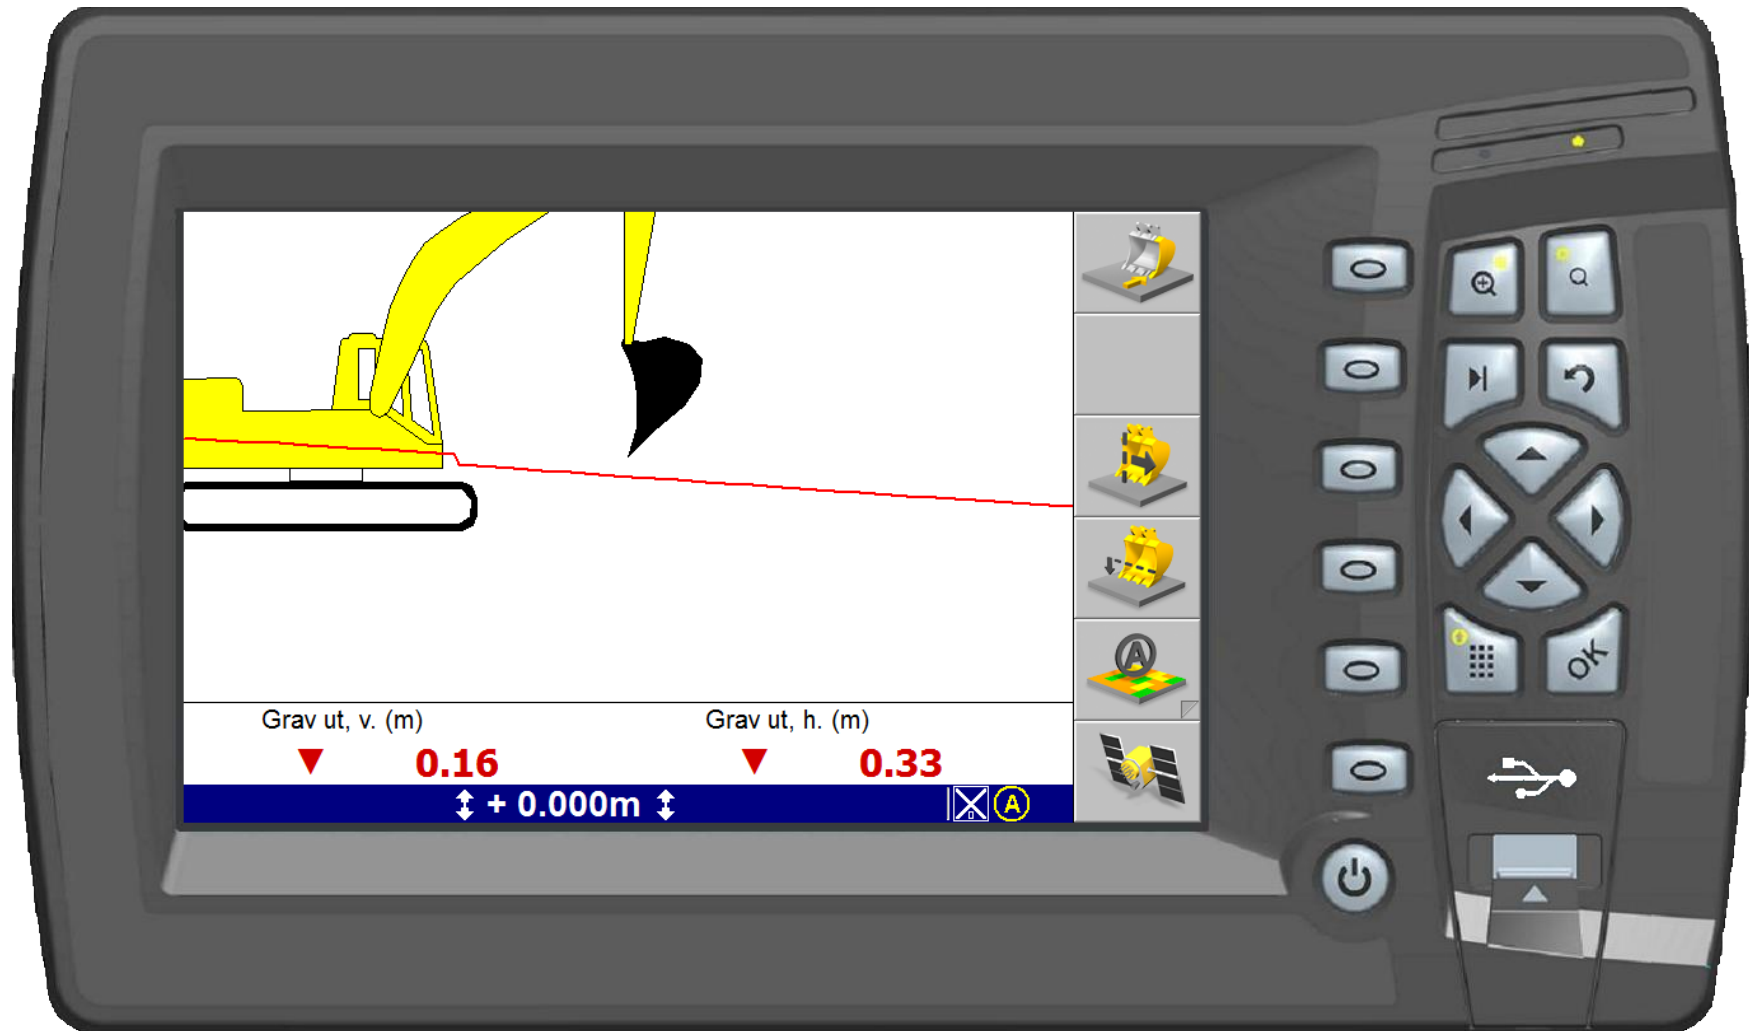

Then we export to field

- **To machine or to field controller**
- **In our own format**
- **And the machine gets guidance**
- **Can stakeout road designs**
- **Check as-built**
- **Make reports**
- **«Dead end?» Will LandXML be more dynamic?**

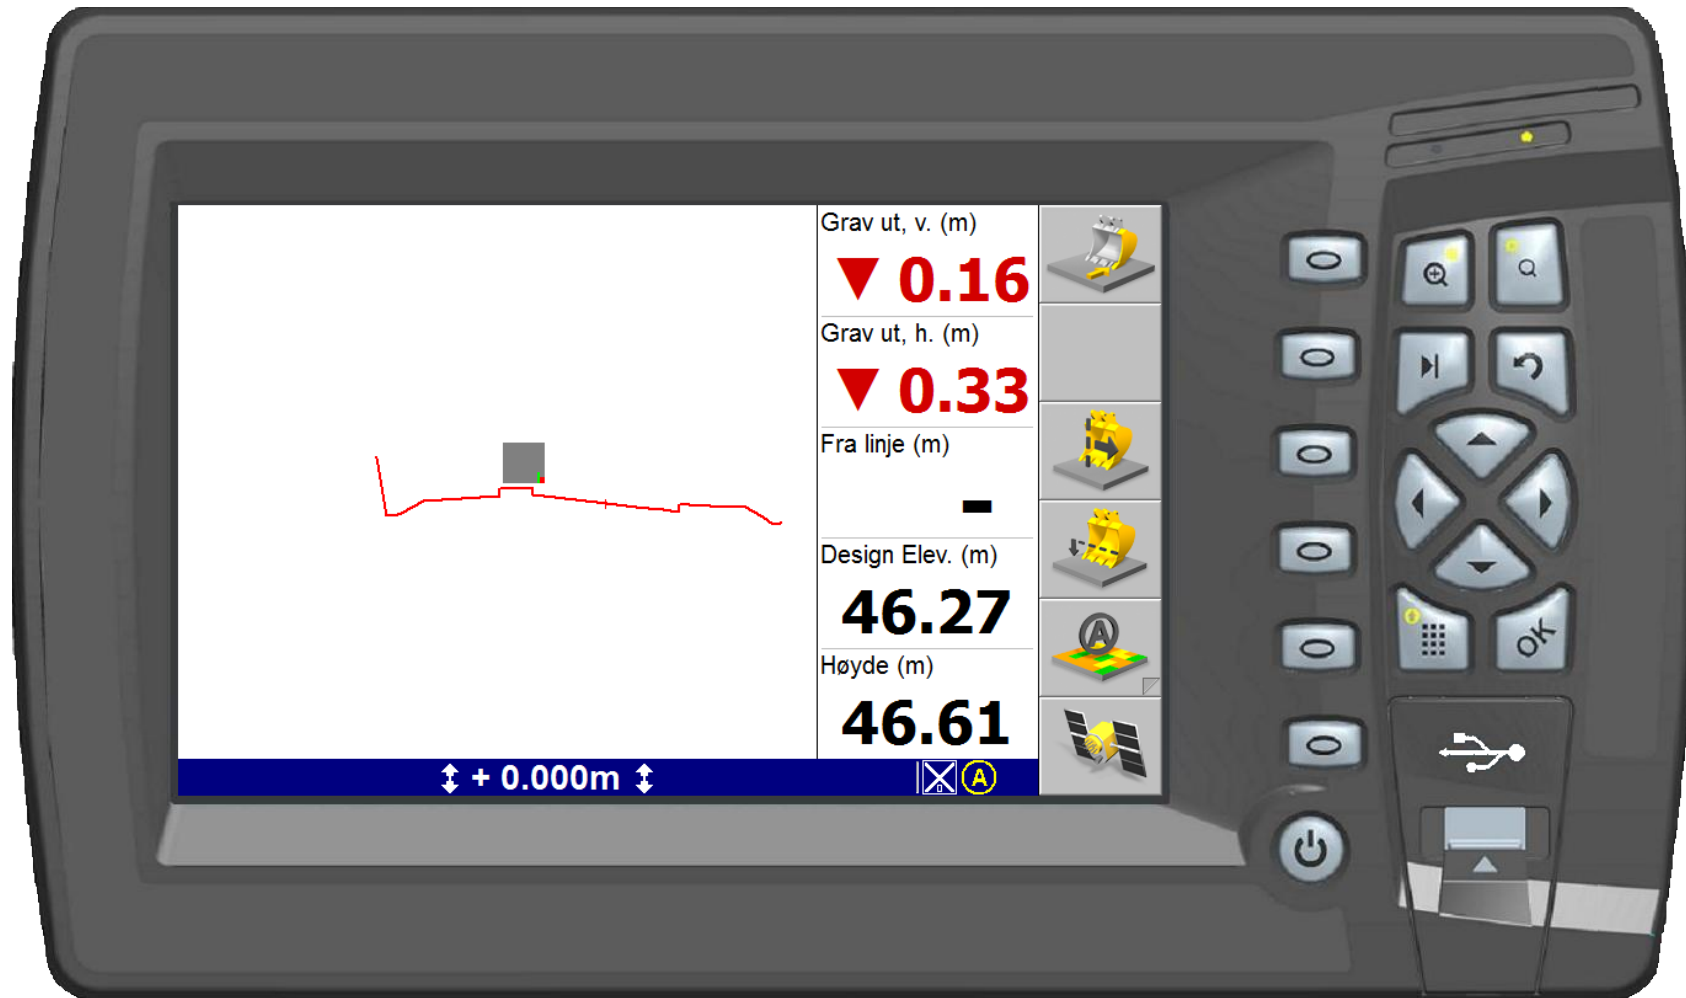

In different views

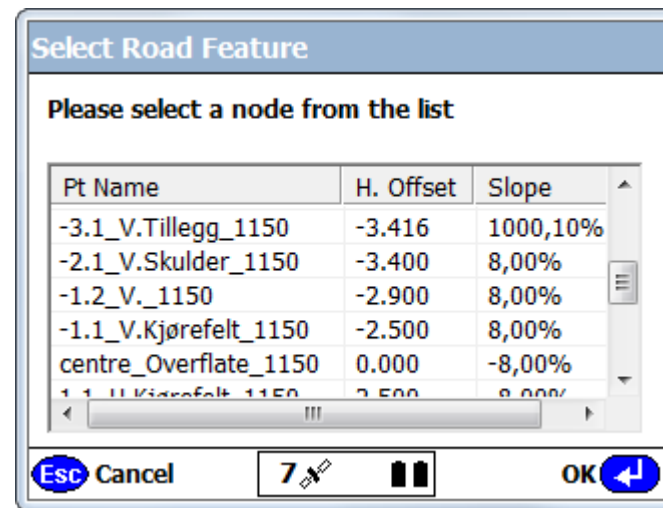

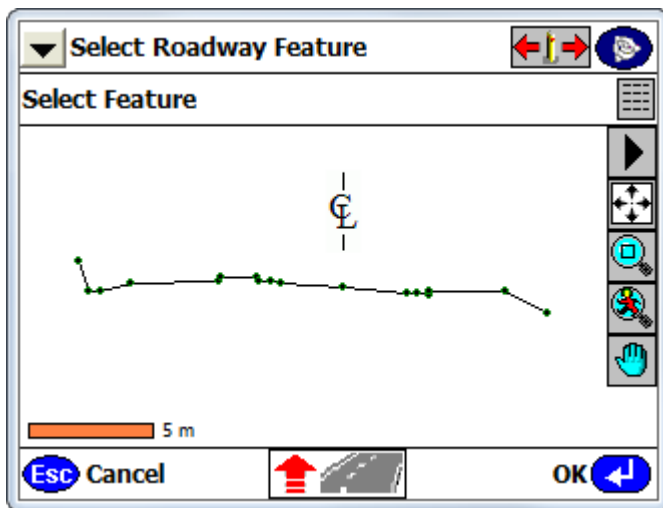

GCS900

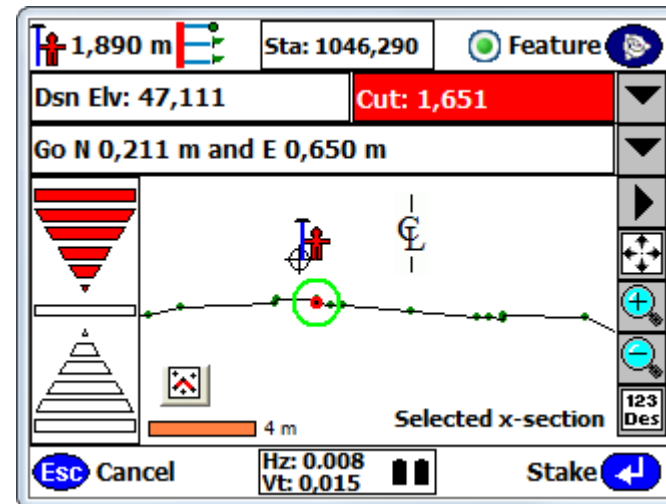

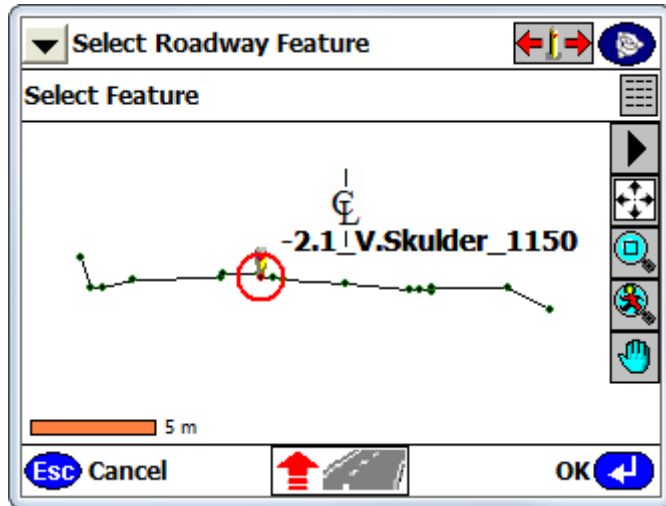

GCS900

Or in the Controller

SCS900

Benefits

- **Relatively small files**
- **Almost «standard»**
- **Can be exchanged to other systems**
- **Gives us what we need**
- **Most software systems can handle it**

Out of LandXML

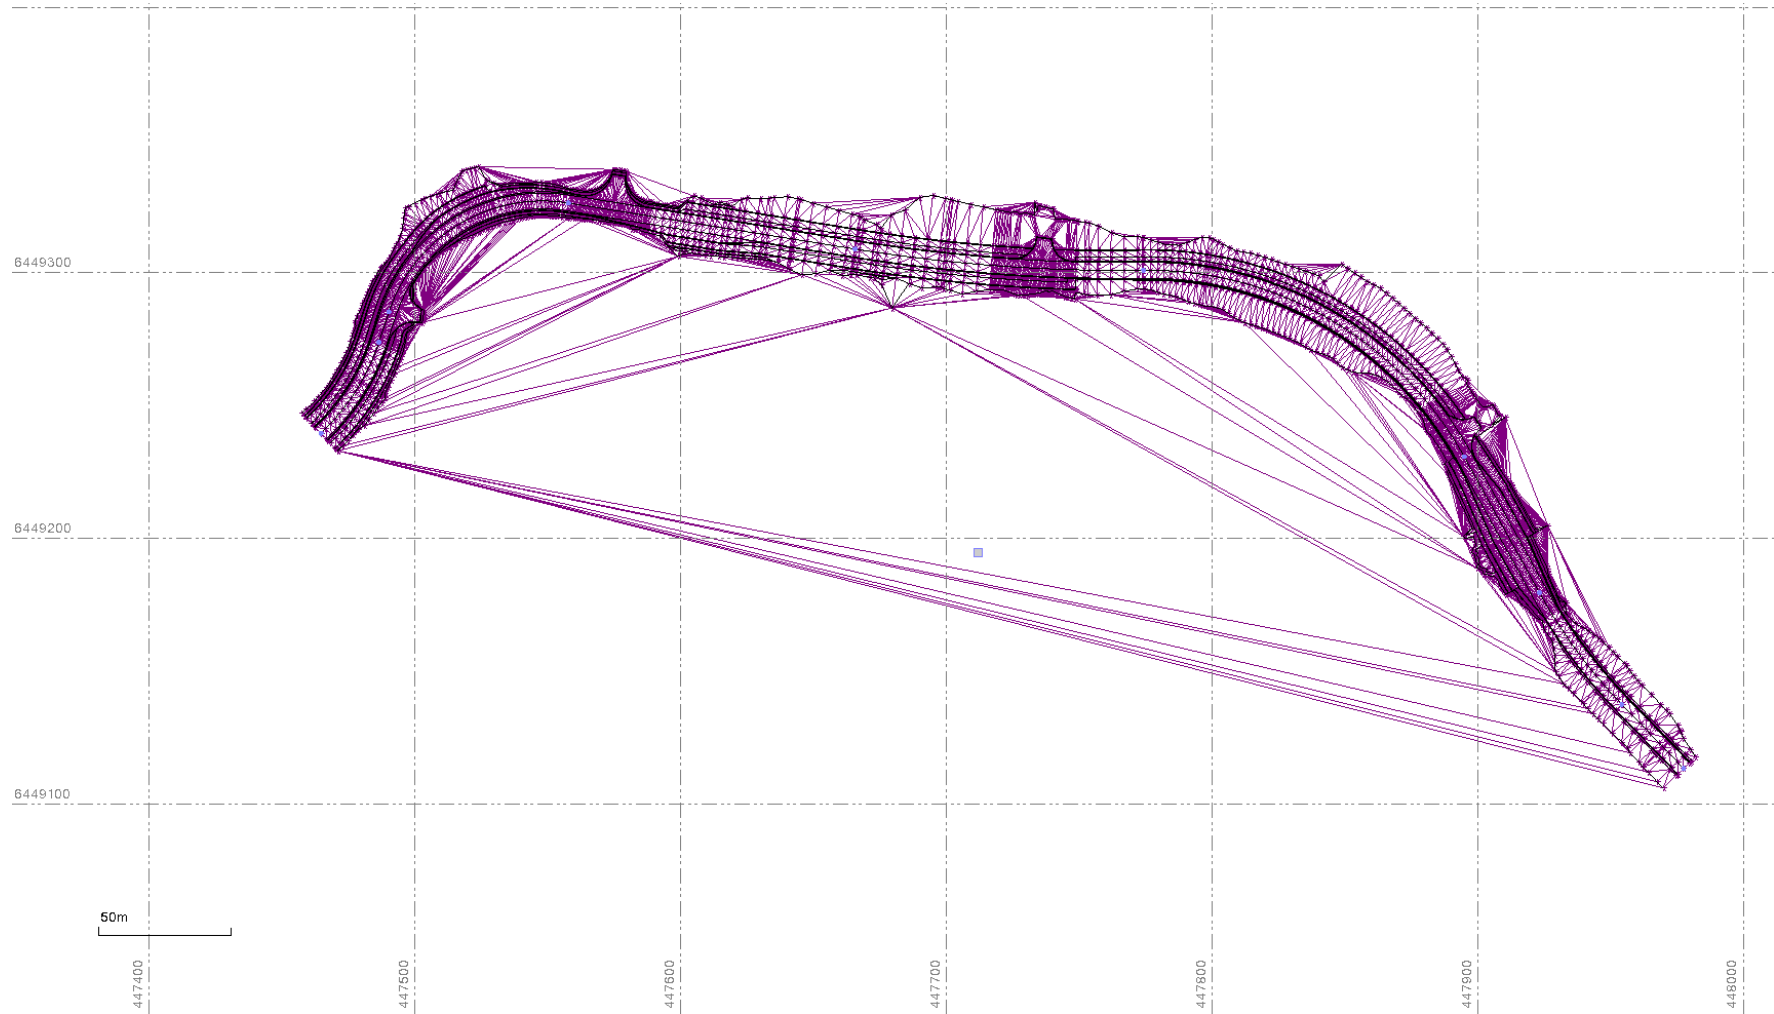

- **We get surface**
- **We get alignments**
- **We get 3D lines**
- **We can work with high accuracy**
- **Typically <3-4 cm with GNSS**
- **Get it right first time**
- **Save time, resources and money**

Issues

- **We see some issues in the difference between 3D lines and Cross Sections from various software**
- **Cross Sections seems to make «blocks» in the road.**
- **Then we loose guidance when crossing over to the next «block»**
- **Surface is generated when imported, must be cleaned up and made Alignment Based**

Surface cleanup

Cleaned up

More issues

- **We also see that some consultants does not deliver LandXML as standard.**
 - **They deliver VIPS, PDF or some ASCII formats.**
 - **Then the road must either be generated from the VIPS.**
 - **Or it must be made from other formats, and be built in proper software.**
-
-

Future

- **We advice our customers to use LandXML**
- **But still it needs to be checked prior to production.**
- **Can we in the future rely on the format?**
- **Will variuos software producers make one version of the LandXML format?**
- **What can be delivered as-built in LandXML?**

Questions?
